PostRandom.4p. Order 2nd REPUBLICAN SENATE CAND

Order for 2nd Republican Senate candidate thermometer (D1s)

.....

Respondents were administered political name thermometers D1d-D1y (16 names) in random order.
 This corresponds to the candidate running in the state of the respondent's location (residence).
 There were 2 Senate elections in Mississippi and Wyoming. This is the order assigned to the case; if the state was not MS or WY, then the thermometer for 2nd Republican Senate candidate was not administered.

√ SPLITSAM SPLIT NEW - Numeric Dec 0

C1b

IF R SELECTED FOR VERSION "NEW":

In asking people about elections, we often find that a lot of people were not able to vote because they weren't registered, they were sick, they didn't have time, or something else happened to prevent them from voting.

And sometimes, people who usually vote or who planned to vote forget that something unusual happened on Election Day one year that prevented them from voting that time. So please think carefully for a minute about the recent elections, and other past elections in which you may have voted, and answer the following questions about your voting behavior.

.....

===== Numeric Dec 0

D1

Please look at page 3 of the booklet.
I'd like to get your feelings toward some of our political leaders and other people who are in the news these days.

I'll read the name of a person and I'd like you to rate that person using something we call the feeling thermometer. Ratings between 50 degrees and 100 degrees mean that you feel favorable and warm toward the person. Ratings between 0 degrees and 50 degrees mean that you don't feel favorable toward the person and that you don't care too much for that person. You would rate the person at the 50 degree mark if you don't feel particularly warm or cold toward the person.

If we come to a person whose name you don't recognize, you don't need to rate that person. Just tell me and we'll move on to the next one.

V085311	√ FWD/REV	Numeric Dec 0
AMP.1	AMP.1. 1st BLACK FACE PHOTO: response (P or Q)	

1st BLACK FACE PHOTO: response (P or Q)

From the self-administered AMP module, this is the response coded by the Respondent for the 1st facial photo/Chinese-character pairing of images in which the displayed photo was that of a black male face.

In the AMP module, 48 total pairings of photos and Chinese characters were displayed to the Respondent: the photo (of a young male) was flashed very briefly before display of a Chinese character that remained onscreen more perceptibly. After both had flashed/displayed, a grey screen appeared where the respondent coded a response to the Chinese character graphic ('Pleasant' or 'Unpleasant').

The order in which the photos and pictographs were administered was randomized. Each pairing represented either 1 of 12 photos of white male faces or else 1 of 12 photos of black male faces, together with 1 Chinese character (note: each face was selected twice for administration). See the User Guide for the photos used in the AMP module.

AMP.1 through AMP.24d represent the 24 iterations for black male faces, in the relative order of their (random) selection for presentation (order for the 24 pairs in AMP.1-AMP.24d: first black face displayed, 2nd black face displayed, etc.).

SPECIAL NOTE: as the result of a technical glitch, for all cases, the 1st photo/Chinese character pair, although properly selected by the algorithm, was not actually administered (displayed) to the respondent. Variables representing the nth iteration in the AMP series where n=1 will have cases coded -4.

See AMP.50 for respondents unable to complete the AMP module due to visual limitations.

The 48 iterations in the AMP module were preceded by 4 "test" administrations of response to Chinese characters alone; data for these test administrations are not available.

- 0. Coded 'Q' ('Unpleasant')
- 1. Coded 'P' ('Pleasant')

AMP.5 AMP.5. 5th BLACK FACE PHOTO: response (P or Q)

5th BLACK FACE PHOTO: response (P or Q)

.....

From the self-administered AMP module, this is the response coded by the Respondent for the 5th facial photo/Chinese-character pairing of images in which the displayed photo was that of a black male face.

In the AMP module, 48 total pairings of photos and Chinese characters were displayed to the Respondent: the photo (of a young male) was flashed very briefly before display of a Chinese character that remained onscreen more perceptibly. After both had flashed/displayed, a grey screen appeared where the respondent coded a response to the Chinese character graphic ('Pleasant' or 'Unpleasant').

The order in which the photos and pictographs were administered was randomized. Each pairing represented either 1 of 12 photos of white male faces or else 1 of 12 photos of black male faces, together with 1 Chinese character (note: each face was selected twice for administration). See the User Guide for the photos and pictographs used in the AMP module.

AMP.1 through AMP.24d represent the 24 iterations for black male faces, in the relative order of their (random) selection for presentation (order for the 24 pairs in AMP.1-AMP.24d: first black face displayed, 2nd black face displayed, etc.).

SPECIAL NOTE: as the result of a technical glitch, for all cases, the 1st photo/Chinese character pair, although properly selected by the algorithm, was not actually administered (displayed) to the respondent. Variables representing the nth iteration in the AMP series where n=1 will have cases coded -4.

See AMP.50 for respondents unable to complete the AMP module due to visual limitations.

The 48 iterations in the AMP module were preceded by 4 "test" administrations of response to Chinese characters alone; data for these test administrations are not available.

V085322 Numeric Dec 0
 AMP.12 AMP.12. 12th BLACK FACE PHOTO: response (P or Q)

12th BLACK FACE PHOTO: response (P or Q)

From the self-administered AMP module, this is the response coded by the Respondent for the 12th facial photo/Chinese-character pairing of images in which the displayed photo was that of a black male face.

In the AMP module, 48 total pairings of photos and Chinese characters were displayed to the Respondent: the photo (of a young male) was flashed very briefly before display of a Chinese character that remained onscreen more perceptibly. After both had flashed/displayed, a grey screen appeared where the respondent coded a response to the Chinese character graphic ('Pleasant' or 'Unpleasant').

The order in which the photos and pictographs were administered was randomized. Each pairing represented either 1 of 12 photos of white male faces or else 1 of 12 photos of black male faces, together with 1 Chinese character (note: each face was selected twice for administration). See the User Guide for the photos and pictographs used in the AMP module.

AMP.1 through AMP.24d represent the 24 iterations for black male faces, in the relative order of their (random) selection for presentation (order for the 24 pairs in AMP.1-AMP.24d: first black face displayed, 2nd black face displayed, etc.).

SPECIAL NOTE: as the result of a technical glitch, for all cases, the 1st photo/Chinese character pair, although properly selected by the algorithm, was not actually administered (displayed) to the respondent. Variables representing the nth iteration in the AMP series where n=1 will have cases coded -4.

See AMP.50 for respondents unable to complete the AMP module due to visual limitations.

The 48 iterations in the AMP module were preceded by 4 "test" administrations of response to Chinese characters alone; data for these test administrations are not available.

- 2. No Post-election IW
- 4. Not administered due to programming error (selected for the 1st administered photo/Chinese character pair)

V085329 Numeric Dec 0
 AMP.19 AMP.19. 19th BLACK FACE PHOTO: response (P or Q)

19th BLACK FACE PHOTO: response (P or Q)

.....

From the self-administered AMP module, this is the response coded by the Respondent for the 19th facial photo/Chinese-character pairing of images in which the displayed photo was that of a black male face.

In the AMP module, 48 total pairings of photos and Chinese characters were displayed to the Respondent: the photo (of a young male) was flashed very briefly before display of a Chinese character that remained onscreen more perceptibly. After both had flashed/displayed, a grey screen appeared where the respondent coded a response to the Chinese character graphic ('Pleasant' or 'Unpleasant').

The order in which the photos and pictographs were administered was randomized. Each pairing represented either 1 of 12 photos of white male faces or else 1 of 12 photos of black male faces, together with 1 Chinese character (note: each face was selected twice for administration). See the User Guide for the photos and pictographs used in the AMP module. AMP.1 through AMP.24d represent the 24 iterations for black male faces, in the relative order of their (random) selection for presentation (order for the 24 pairs in AMP.1-AMP.24d: first black face displayed, 2nd black face displayed, etc.).

SPECIAL NOTE: as the result of a technical glitch, for all cases, the 1st photo/Chinese character pair, although properly selected by the algorithm, was not actually administered (displayed) to the respondent. Variables representing the nth iteration in the AMP series where n=1 will have cases coded -4.

See AMP.50 for respondents unable to complete the AMP module due to visual limitations. The 48 iterations in the AMP module were preceded by 4 "test" administrations of response to Chinese characters alone; data for these test administrations are not available.

AMP.20 AMP.20. 20th BLACK FACE PHOTO: response (P or Q)

20th BLACK FACE PHOTO: response (P or Q)

.....

From the self-administered AMP module, this is the response coded by the Respondent for the 20th facial photo/Chinese-character pairing of images in which the displayed photo was that of a black male face.

In the AMP module, 48 total pairings of photos and Chinese characters were displayed to the Respondent: the photo (of a young male) was flashed very briefly before display of a Chinese character that remained onscreen more perceptibly. After both had flashed/displayed, a grey screen appeared where the respondent coded a response to the Chinese character graphic ('Pleasant' or 'Unpleasant').

The order in which the photos and pictographs were administered was randomized. Each pairing represented either 1 of 12 photos of white male faces or else 1 of 12 photos of black male faces, together with 1 Chinese character (note: each face was selected twice for administration). See the User Guide for the photos and pictographs used in the AMP module.

AMP.1 through AMP.24d represent the 24 iterations for black male faces, in the relative order of their (random) selection for presentation (order for the 24 pairs in AMP.1-AMP.24d: first black face displayed, 2nd black face displayed, etc.).

SPECIAL NOTE: as the result of a technical glitch, for all cases, the 1st photo/Chinese character pair, although properly selected by the algorithm, was not actually administered (displayed) to the respondent. Variables representing the nth iteration in the AMP series where n=1 will have cases coded -4.

See AMP.50 for respondents unable to complete the AMP module due to visual limitations.

The 48 iterations in the AMP module were preceded by 4 "test" administrations of response to Chinese characters alone; data for these test administrations are not available.

V085336
AMP.26

AMP.26. 2nd WHITE FACE PHOTO: response (P or Q)

Numeric Dec 0

2nd WHITE FACE PHOTO: response (P or Q)
.....

From the self-administered AMP module, this is the response coded by the Respondent for the 1st facial photo/Chinese-character pairing of images in which the displayed photo was that of a white male face.

In the AMP module, 48 total pairings of photos and Chinese characters were displayed to the Respondent: the photo (of a young male) was flashed very briefly before display of a Chinese character that remained onscreen more perceptibly. After both had flashed/displayed, a grey screen appeared where the respondent coded a response to the Chinese character graphic ('Pleasant' or 'Unpleasant').

The order in which the photos and pictographs were administered was randomized. Each pairing represented either 1 of 12 photos of white male faces or else 1 of 12 photos of black male faces, together with 1 Chinese character (note: each face was selected twice for administration). See the User Guide for the photos and pictographs used in the AMP module.

AMP.25 through AMP.48d represent the 24 iterations for white male faces, in the relative order of their (random) selection for presentation (order for the 24 pairs in AMP.25-AMP.48d: first white face displayed, 2nd white face displayed, etc.).

SPECIAL NOTE: as the result of a technical glitch, for all cases, the 1st photo/Chinese character pair, although properly selected by the algorithm, was not actually administered (displayed) to the respondent. Variables representing the nth iteration in the AMP series where n=1 will have cases coded -4.

See AMP.50 for respondents unable to complete the AMP module due to visual limitations.

The 48 iterations in the AMP module were preceded by 4 "test" administrations of response to Chinese characters alone; data for these test administrations are not available.

.....

From the self-administered AMP module, this is the response coded by the Respondent for the 1st facial photo/Chinese-character pairing of images in which the displayed photo was that of a white male face.

In the AMP module, 48 total pairings of photos and Chinese characters were displayed to the Respondent: the photo (of a young male) was flashed very briefly before display of a Chinese character that remained onscreen more perceptibly. After both had flashed/displayed, a grey screen appeared where the respondent coded a response to the Chinese character graphic ('Pleasant' or 'Unpleasant').

The order in which the photos and pictographs were administered was randomized. Each pairing represented either 1 of 12 photos of white male faces or else 1 of 12 photos of black male faces, together with 1 Chinese character (note: each face was selected twice for administration). See the User Guide for the photos and pictographs used in the AMP module. AMP.25 through AMP.48d represent the 24 iterations for white male faces, in the relative order of their (random) selection for presentation (order for the 24 pairs in AMP.25-AMP.48d: first white face displayed, 2nd white face displayed, etc.). SPECIAL NOTE: as the result of a technical glitch, for all cases, the 1st photo/Chinese character pair, although properly selected by the algorithm, was not actually administered (displayed) to the respondent. Variables representing the nth iteration in the AMP series where n=1 will have cases coded -4.

See AMP.50 for respondents unable to complete the AMP module due to visual limitations.

The 48 iterations in the AMP module were preceded by 4 "test" administrations of response to Chinese characters alone; data for these test administrations are not available.

AMP.39	AMP.39. 15th WHITE FACE PHOTO: response (P or Q)	

15th WHITE FACE PHOTO: response (P or Q)

From the self-administered AMP module, this is the response coded by the Respondent for the 1st facial photo/Chinese-character pairing of images in which the displayed photo was that of a white male face.

In the AMP module, 48 total pairings of photos and Chinese characters were displayed to the Respondent: the photo (of a young male) was flashed very briefly before display of a Chinese character that remained onscreen more perceptibly. After both had flashed/displayed, a grey screen appeared where the respondent coded a response to the Chinese character graphic ('Pleasant' or 'Unpleasant').

The order in which the photos and pictographs were administered was randomized. Each pairing represented either 1 of 12 photos of white male faces or else 1 of 12 photos of black male faces, together with 1 Chinese character (note: each face was selected twice for administration). See the User Guide for the photos and pictographs used in the AMP module.

AMP.25 through AMP.48d represent the 24 iterations for white male faces, in the relative order of their (random) selection for presentation (order for the 24 pairs in AMP.25-AMP.48d: first white face displayed, 2nd white face displayed, etc.).

SPECIAL NOTE: as the result of a technical glitch, for all cases, the 1st photo/Chinese character pair, although properly selected by the algorithm, was not actually administered (displayed) to the respondent. Variables representing the nth iteration in the AMP series where n=1 will have cases coded -4.

See AMP.50 for respondents unable to complete the AMP module due to visual limitations.

The 48 iterations in the AMP module were preceded by 4 "test" administrations of response to Chinese characters alone; data for these test administrations are not available.

V085356 Numeric Dec 0
 AMP.46 AMP.46. 22nd WHITE FACE PHOTO: response (P or Q)

22nd WHITE FACE PHOTO: response (P or Q)

From the self-administered AMP module, this is the response coded by the Respondent for the 1st facial photo/Chinese-character pairing of images in which the displayed photo was that of a white male face.

In the AMP module, 48 total pairings of photos and Chinese characters were displayed to the Respondent: the photo (of a young male) was flashed very briefly before display of a Chinese character that remained onscreen more perceptibly. After both had flashed/displayed, a grey screen appeared where the respondent coded a response to the Chinese character graphic ('Pleasant' or 'Unpleasant').

The order in which the photos and pictographs were administered was randomized. Each pairing represented either 1 of 12 photos of white male faces or else 1 of 12 photos of black male faces, together with 1 Chinese character (note: each face was selected twice for administration). See the User Guide for the photos and pictographs used in the AMP module.

AMP.25 through AMP.48d represent the 24 iterations for white male faces, in the relative order of their (random) selection for presentation (order for the 24 pairs in AMP.25-AMP.48d: first white face displayed, 2nd white face displayed, etc.).

SPECIAL NOTE: as the result of a technical glitch, for all cases, the 1st photo/Chinese character pair, although properly selected by the algorithm, was not actually administered (displayed) to the respondent. Variables representing the nth iteration in the AMP series where n=1 will have cases coded -4.

See AMP.50 for respondents unable to complete the AMP module due to visual limitations.

The 48 iterations in the AMP module were preceded by 4 "test" administrations of response to Chinese characters alone; data for these test administrations are not available.

- 2. No Post-election IW
- 4. Not administered due to programming error (selected for the 1st administered photo/Chinese character pair)
- 5. INAP, not completed by respondent
