

Why Python?

(Intro. to Python 1)

Dr. Ryan Krauss

Grand Valley State University

Why Python?

- ▶ free/open-source

Why Python?

- ▶ free/open-source
- ▶ clean syntax

Why Python?

- ▶ free/open-source
- ▶ clean syntax
- ▶ powerful and all purpose

Why Python?

- ▶ free/open-source
- ▶ clean syntax
- ▶ powerful and all purpose
- ▶ easy to learn

Why Python?

- ▶ free/open-source
- ▶ clean syntax
- ▶ powerful and all purpose
- ▶ easy to learn
- ▶ "batteries included"

Why Python?

- ▶ free/open-source
- ▶ clean syntax
- ▶ powerful and all purpose
- ▶ easy to learn
- ▶ "batteries included"
 - ▶ many, many libraries available

Why Python?

- ▶ free/open-source
- ▶ clean syntax
- ▶ powerful and all purpose
- ▶ easy to learn
- ▶ "batteries included"
 - ▶ many, many libraries available
 - ▶ python-control library will be very valuable for our class

Why Python?

- ▶ free/open-source
- ▶ clean syntax
- ▶ powerful and all purpose
- ▶ easy to learn
- ▶ "batteries included"
 - ▶ many, many libraries available
 - ▶ python-control library will be very valuable for our class
 - ▶ **numpy, scipy, matplotlib, IPython, spyder,**

Why Python?

- ▶ free/open-source
- ▶ clean syntax
- ▶ powerful and all purpose
- ▶ easy to learn
- ▶ "batteries included"
 - ▶ many, many libraries available
 - ▶ python-control library will be very valuable for our class
 - ▶ numpy, scipy, matplotlib, IPython, spyder,
- ▶ I like it and have a lot of experience using and teaching it

What do we need for dynamic systems and control?

- ▶ model dynamic systems and simulate their response to various inputs

What do we need for dynamic systems and control?

- ▶ model dynamic systems and simulate their response to various inputs
 - ▶ numeric integration

What do we need for dynamic systems and control?

- ▶ model dynamic systems and simulate their response to various inputs
 - ▶ numeric integration
 - ▶ transfer functions

What do we need for dynamic systems and control?

- ▶ model dynamic systems and simulate their response to various inputs
 - ▶ numeric integration
 - ▶ transfer functions
- ▶ process experimental data (.csv or .xlsx)

What do we need for dynamic systems and control?

- ▶ model dynamic systems and simulate their response to various inputs
 - ▶ numeric integration
 - ▶ transfer functions
- ▶ process experimental data (.csv or .xlsx)
- ▶ find frequency response of various systems

What do we need for dynamic systems and control?

- ▶ model dynamic systems and simulate their response to various inputs
 - ▶ numeric integration
 - ▶ transfer functions
- ▶ process experimental data (.csv or .xlsx)
- ▶ find frequency response of various systems
- ▶ design feedback control systems based on root locus and Bode

What do we need for dynamic systems and control?

- ▶ model dynamic systems and simulate their response to various inputs
 - ▶ numeric integration
 - ▶ transfer functions
- ▶ process experimental data (.csv or .xlsx)
- ▶ find frequency response of various systems
- ▶ design feedback control systems based on root locus and Bode

What do we need for dynamic systems and control?

- ▶ model dynamic systems and simulate their response to various inputs
 - ▶ numeric integration
 - ▶ transfer functions
- ▶ process experimental data (.csv or .xlsx)
- ▶ find frequency response of various systems
- ▶ design feedback control systems based on root locus and Bode
- ▶ Big Idea: Python has open-source libraries for doing all of these things and it is free and fairly easy to learn

Python vs. C syntax 1

- Python uses dynamic typing, so you do not have to pre-declare your variable types

C

```
int a;  
a = 7;
```

Python

```
a = 7
```

Python vs. C syntax 1

- ▶ Python uses dynamic typing, so you do not have to pre-declare your variable types
- ▶ semi-colons are not necessary at the end of every line

C

```
int a;  
a = 7;
```

Python

```
a = 7
```

Python vs C. Syntax 2: for loops

C

```
for (int i=0; i<10; i++) {  
    cout << "i = " << i  
}
```

Python

```
for i in range(10):  
    print('i = ' + str(i))
```

Python vs. C: functions

C

```
int my_C_func(int A, int B) {  
    int C;  
    C = A + B;  
    return C;  
}
```

Python

```
def my_Python_func(A, B):  
    C = A + B  
    return C
```

C functions: only 1 return value

- ▶ C functions can only return one thing

```
// declare D outside of function
```

```
int D;
```

```
int my_C_func(int A, int B, int* D) {
```

```
    int C;
```

```
    C = A + B;
```

```
    D = A*B;
```

```
    return C;
```

```
}
```

```
// call passing in pointer to D
```

```
my_C_func(2, 7, &D);
```

C functions: only 1 return value

- ▶ C functions can only return one thing
 - ▶ to work around this, you have to pass in a pointer for your other "outputs"

```
// declare D outside of function
```

```
int D;
```

```
int my_C_func(int A, int B, int* D) {
```

```
    int C;
```

```
    C = A + B;
```

```
    D = A*B;
```

```
    return C;
```

```
}
```

```
// call passing in pointer to D
```

```
my_C_func(2, 7, &D);
```

Python functions: multiple return values

Returning multiple values from a Python function is straightforward:

```
def my_Python_func(A, B) :  
    C = A + B  
    D = A*B  
    return C, D
```

Learning a new language

- ▶ what things do you need to learn to use a new language for engineering purposes?

Learning a new language

- ▶ what things do you need to learn to use a new language for engineering purposes?
 - ▶ basic syntax

Learning a new language
